

Water is the most essential element, but the industry is just as important. There is a limited amount of water on earth. The majority of the water is not potable. Therefore, the world needs to take care of the water that is potable and available for daily needs. This is where the water industry comes into play. The water industry filters water for humans twenty-four hours a day for three hundred sixty-five days out of a year. The water industry takes water from the ground, sends it to a treatment plant, and eventually provides clean water to the citizens of the area.

If there were no water industry, America would change. Humans have been programmed only to understand running water. Many Americans would have to use well water for rural and urban life. Therefore, they would have to filter their own water. Water would not be a quick and easy use. It can take up to forty-five minutes to filter water. When there is running water, it takes a matter of seconds to have potable water for any daily need. Without the water industry, water would be filthy, full of bacteria and parasites, and cause medical problems for humans. The water would not be viable to clean houses, hospitals, and the human body. Hospitals use water for everything. They use it to clean tools, beds, and patients. Diseases and infections would travel more easily from person to person. They will not just be transmitted through humans but the water they drink. Water would be unsanitary and carry pathogens that can ultimately cause sickness. Humans use water every day for simple life tasks like showering, brushing their teeth, and making food. Potable water affects not only humans but also all agriculture, pets, and livestock. Agriculture has become easier since the evolution of the water industry. Agriculture provides food for everyone around the world. Most farmers fill their sprayers with water in their yards. Before the invention of running water, a farmer had to do strenuous activities to get water. Animals are well nourished with filtered water, creating more food for the growing population.

Overall, the water industry has evolved over time, creating more opportunities for companies, people, and everyday life. The water industry has made the transport of water to the world's homes and businesses quicker. Without the water industry, the world would struggle to do simple life tasks and maintain health.
